

Scope Statement

Project Title: Member Registration & Authentication System

Date: Oct 22, 2025 **Prepared by:** Access Control Team – Springfield Public Library

Project Justification:

The Springfield Public Library currently requires residents to visit in person to complete a paper membership form. This results in lengthy processing times, restricts accessibility to business hours, increases the workload of librarians through manual data entry, and introduces a higher risk of lost or incomplete forms.

This sub-project will deliver a web-based registration and authentication module that enables residents to submit library membership applications online and securely log in once approved.

This solution will:

- Reduce registration time by at least 70%
- Eliminate manual form handling and data re-entry
- Allow 24/7 online access for new and existing members
- Strengthen privacy and security through encrypted credentials and controlled authentication

This system is a required foundation for all other LibraLite modules because no user can access library services without an approved and authenticated account

Product Characteristics and Requirements:

1. Online Registration

- Web form collects: Full Name, Email, Phone Number, Date of Birth, and a 4-digit PIN
- All fields are mandatory; form validation prevents incomplete submissions
- Successful submissions are stored in the Member database with status “Pending Approval”

2. Application Approval Workflow (Staff-Facing)

- Librarians view pending applications through the Staff Dashboard (UI built by another team)
- Librarians can set the status to: Approved, Rejected, or Pending
- Approved accounts are changed to Active
- Rejections store a short text reason

3. Secure Login & Authentication

- Members log in using Library Card Number + 4-digit PIN

- Successful logins create a secure session.

Product User Acceptance Criteria:

This sub-project will be accepted when all of the following are true:

- A resident can register and their information is saved in Firestore
- A member can log in using card number + PIN
- Login fails if credentials don't match or formatting is invalid
- The system generates a unique 8-digit card number during registration
- All test cases for registration and login pass successfully

Summary of Project Deliverables

Business Case, Project Charter, Team Contract, Scope Statement, Requirements Document, Requirements Traceability Matrix, WBS, Gantt Schedule, Cost Baseline, Risk Register, Status Reports, Final Presentation, Final Report, Lessons Learned.

Product Deliverables:

1. Registration Page (React.js)
2. Login Page with validation
3. Firebase Member Service (registration + login + card generation)
4. Home Page with logout
5. Firestore database setup
6. Basic documentation and test results
